# 1.0 Introduction

A unified and efficient communication platform is becoming more and more necessary within the UiTM KT campus community. Students currently rely on dispersed channels, like Telegram and WhatsApp, to learn about events, activities, and formal announcements on campus. However, students who want to keep informed and involved may face difficulties due to the erratic nature of these platforms, which is made worse by the flood of spam messages and unapproved information.

UCircle, a comprehensive mobile application designed with the UiTM KT community in mind, aims to solve the deficiencies of current communication channels by acknowledging these difficulties and providing a solution. The mission of UCircle is to transform how students interact with their peers and campus organizations, obtain information, and take part in events on campus. Through the integration of official announcements, event promotions, and community conversations into a unified, easily navigable platform, UCircle hopes to improve information accessibility, expedite communication, and cultivate a feeling of community among UiTM KT members.

## 2.0 Problem Statement

The UiTM KT community faces some challenges in accessing and managing information relevant to campus activities and events. These challenges pop out from the fragmented nature of communication channels, the overflow of repetitive content, and the unauthorized messages that passed through the chat. As a result, students encounter difficulties in staying updated with current information, scrolling through cluttered chat channels, and recognizing preferred event promotions from spam or irrelevant content.

The primary issue arises from the blend of official announcements, event promotions, and casual chats within single platform chat channels. This mixing of content leads to a cluttered and disorganized environment, making it hard for students to look through messages and recognize relevant information. Consequently, students often miss out on important updates and struggle to find upcoming events tailored to their interests amid the sea of messages.

Next, the constant reposting of event promotions by organizers just floods the platform with repetitive content. This flood of redundant messages not only overwhelms students but also fosters frustration, as they are forced to look through the same information repeatedly. Moreover, the presence of spam messages, advertisements, scam, and fake news further worsen the issue, reducing the quality of communication within the community and spoil the trust in the information shared.

Additionally, the infiltration of outsiders into the chat channels intended exclusively for the UiTM KT community raises a security concern. The presence of unauthorized individuals not only endangers the privacy and security of students but also disrupts the integrity of the communication platform. This infiltration undermines the sense of community and belonging within the UiTM KT community, as students are unable to engage freely in discussions and activities without the fear of outsiders interference.

## 3.0 Process

- **Sort :**  
Implement a system to separate official announcements & event information into distinct categories to streamline information access.
- **Filter :**  
Introduce filtering options based on category tags to enable students to quickly find relevant events.
- **Manual Post Approval and Management :**  
A team of administrators or moderators responsible for reviewing and approving event promotion requests.
- **User Authentication :**  
Only students and staff of UiTM will manage to log in and use the application, thus preventing the appearance of outsiders.

## 4.0 Scope

This application aims to change the way students and staff interact, access information, and participate in campus events. By addressing existing challenges and leveraging modern technology, UCircle seeks to provide a centralized platform that fosters efficient communication, facilitates event management, and enhances community engagement.

UCircle will offer a user-friendly interface that streamlines access to official announcements, event information, and community discussions. Through categorization and sorting mechanisms, users will be able to navigate through a plethora of information effortlessly, ensuring that relevant updates are readily available while minimizing clutter and information overload. Moreover, the incorporation of push notifications will enable timely dissemination of important announcements, ensuring the students to stay informed even when they are not actively using the application.

One of the primary objectives of UCircle is to address the fragmentation of information channels currently experienced by the UiTM KT community. By consolidating official announcements and event promotions into a single platform, the application aims to eliminate the need for students and staff to navigate through multiple channels, such as Telegram and WhatsApp groups. This consolidation will not only enhance the accessibility of information but also promote a sense of unity and cohesion within the community.

Furthermore, UCircle will introduce innovative features to enhance event management and participation. By implementing filtering options based on user interests and preferences, the application will empower individuals to discover and engage with events that align with their interests, thereby increasing event engagement. Additionally, the introduction of manual post approval and management mechanisms will help mitigate the issue of repetitive event promotions, ensuring that only relevant and authorized content will be shown.

In terms of security and accessibility, UCircle will prioritize user authentication to restrict access exclusively to UiTM students and staff. Drawing inspiration from the UFuture system, robust authentication mechanisms will be implemented to safeguard user privacy and prevent unauthorized access by outsiders. This focus on security underscores the commitment to providing a safe and trusted platform for the UiTM KT community to interact and engage.

## 5.0 Technology Used

- **Online Database**

Firebase is a versatile platform utilized for this project, which offers a range of services that streamlines our development such as cloud firestore database and storage that can store media.

- **UiTM User Authentication**

Security User Authentication that we have modelled after UiTM's system to ensure protection of user data and access control. Inspired by the security measures of UiTM's authentication system, this project implements similar protocols to safeguard sensitive information and authenticate users securely.

- **Push Notifications**

Push Notifications enhance user engagement with our app and encourages timely communication by delivering updates and alerts directly to users' devices. This ensures that the users stay informed about relevant UiTM's activities and events are displayed within the application.

- **PDF Reader**

In-app PDF Reader is used for staff to check the validity of the document sent by the student who is the organizer of the event to make sure the event is not spam and fake. This will make sure that the event that will be displayed in the students' interface has been verified and safe to join.

## 6.0 Wireframe

Our application has two users which are Student and Staff. Each of them will have their own interface that is suitable based on their role. The interfaces shown for them are suitable for their own unique reason to use the app. When users open the application, they will first encounter a Login Page where they need to select their role, which is as student or staff. Then, they need to fill in the email and password of their UiTM account.

After login session success, from the point of view of a student, they will see the lists of events as their homepage. Students can search and use filters by tags that will show the desired event that the student craves. There is also a tab button at the top screen below the app bar where it will navigate to the list of info and announcement. Do note that the list of events and info can be tapped which students can read on a more detailed view. For event detail, students can tap the phone icon to see the contact info. On the app bar, there is a hamburger menu icon where it will open a drawer that contains some stuff like the event that the student posted, a list tile to submit an event if the student organises an event, the about application, and log out from the application list tile. Students can modify the approved event of theirs in case they need to or deleting it. There is also a bell icon at the right top in the app bar where it will show the list of notifications.

Next, after the login session, staff will see a dashboard like interface where the staff can choose where to navigate to events where the staff will see lists of events that are submitted by students for approval. They can tap the event to see the event details and there is a button for staff to check the PDF formatted document for validation of the event to make sure the event that is going to be displayed to students is legit and approved by HEP or assistant rector. For the bulletin section, this is where the staff can post the info or announcement. There is also a hamburger menu where it will show a drawer if tapped. In the drawer, there are two list tiles that can be tapped where one will navigate to the application's about and one is for logging out from the application.

## Student Interface:

## Staff Interface:

## 7.0 Significance

Our app, UCircle, allows students to post, view, and filter relevant events of UiTM which offers significant benefits for both students. Firstly, for students, such an app serves as a centralised hub for discovering events that align with their interests and not missing any latest information about their campus. By providing a platform where students can easily access information about events and announcements, they can enrich their experiences at UiTM by participating in activities outside of their academic curriculum and not easily missing any important notice.

Moreover, the ability to filter events based on interests ensures that students can tailor their experiences to their specific preferences, maximising the relevance and appeal of the events that they choose to attend. This not only enhances their overall satisfaction but also encourages active participation and involvement.

For administrators which consist of certain UiTM staff like the assistant rectors and the HEP, approving events through the app enables them to maintain oversight and ensure that the events align with the university's values and guidelines. By reviewing and approving events, the administrators can uphold standards of safety and relevance, thereby creating a positive environment for student engagement.

Additionally, approving events allows administrators to track the types of activities being hosted near the university using the tracking by filter feature in the app, gaining insights into student interests and preferences. This data can be highly valuable for future planning and decision-making regarding campus programming and resource allocation, especially if it is relayed to students. Overall, an app facilitating event hosting, viewing, and approval near a university serves to enhance student engagement, community connectivity and administrative oversight.
